

# Asset Finder

## A quick visual walkthrough & FAQ

Search your own files — decks, PDFs, Word and Excel files, images and YouTube videos — by meaning, in plain words, on your own computer. This short guide shows you each screen and answers the most common questions. Nothing you search ever leaves your machine.

### 1. The main screen

When you open Asset Finder, this is what you see. Type what you are looking for in plain words and press **Search**. You do not need exact file names — describe what you remember.

**Asset Finder**

Search your decks, PDFs, Word and Excel files and images by meaning - not by filename.

[Search](#) [Processing log](#)

**Search**

What are you looking for?

e.g. star schema, or how to build a resume

**Search**

Content folder: C:\Asset Finder Demo\My content

*The main screen. Search box in the middle, the two tabs (Search and Processing log) at the top, and the settings gear at the top-right.*

**Search box** — type a topic, an idea, or something you half-remember.

**Search / Processing log tabs** — switch between searching and managing your content.

**Gear icon (top-right)** — opens settings (shown in section 3).

**Content folder (bottom)** — shows which folder is currently being searched.

## 2. A search result

Results come back best first, and **only genuine matches are shown**. Each result explains itself, so you know why it came up and can judge it without opening the file.

### Search

Recent searches

who supervises the night shift

What are you looking for?

who supervises the night shift

Search

1 match for "who supervises the night shift", closest first

1. Warehouse handbook.docx

Strong match

Word document · Section: Weekly rota

AI

Why it matched: The image shows the night shift supervisor for Quorventa, listing Tamsin Okonkwo-Relly as the designated supervisor for the night shift.

FROM A PICTURE IN THIS DOCUMENT

This image displays a schedule or rota for the night shift at Quorventa, listing the supervisor, a freezer inspection task with a time, and a deadline for forklift permit renewal. QUORVENTA night shift rota Supervisor: Tamsin Okonkwo-Relly Freezer bay 7 inspection at 06:40 Forklift permits renewed by Friday

Open file

File location — paste into File Explorer to open

C:\Asset Finder Demo\My content\Warehouse handbook.docx

*A result for the search "who supervises the night shift". Notice it found a Word document by the words inside a screenshot pasted into it — not by its file name.*

**Strong match** — an honest confidence label. You may also see "Close match". Never a fake percentage.

**Where it is** — the type of file and the part of it that matched: a slide number, a PDF page, a Word section heading or an Excel sheet name.

**Why it matched** — a short, plain-language reason, written by the AI.

**From a picture in this document** — the match came from a picture or screenshot inside the file; the text below it is what the AI read in the picture, including any words printed in it.

**Preview** — for images you see the picture itself; for videos, a link that opens at the right moment.

**Open file / File location** — open the file directly, or copy its path.

### 3. Settings

Click the gear icon (top-right) to open settings. There are just two choices, and they are remembered while the app is open.

*The settings panel — two simple choices.*

**When nothing matches** — "Show nothing" (a clean, empty result — the default) or "Show closest 3" (up to three genuinely near results). "Show nothing" avoids showing you unrelated files.

**When I click a result** — "Open the file directly" (opens the actual file — best on your own machine) or "Download the file" (a copy — best when others use the app over your network).

### 4. Which files it can read

Point the app at a folder and it reads these file types, including everything in sub-folders:

| File                | What it reads                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PowerPoint (.pptx)  | The text on every slide, and the pictures and screenshots on them.                                                                                                                                                                         |
| PDF (.pdf)          | The text on every page.                                                                                                                                                                                                                    |
| Word (.docx)        | The text, including tables, <b>and the screenshots and pictures pasted into it</b> . Results point to the heading a match sits under, because Word files have no fixed pages.                                                              |
| Excel (.xlsx)       | Sheet names and the text in the cells, <b>and pictures placed on a sheet</b> . Works best for sheets that hold words (lists, notes, trackers) — a big table of numbers is found by its sheet name and column headings, not by the figures. |
| Images (.png, .jpg) | What the picture shows, and any words printed in it.                                                                                                                                                                                       |
| YouTube videos      | What is said in them, from their captions — listed in a <code>public_links.xlsx</code> spreadsheet.                                                                                                                                        |

**Older .doc and .xls files are not read.** Open them in Word or Excel and save them as .docx or .xlsx first. Anything the app cannot read is listed as "Skipped" — nothing is wrong with it.

## 5. The Processing log

This page is where you point the app at your content, start reading it, and check what has been read. It is also your proof of what the app knows.

### Processing log

What the app has read, what it skipped, and anything that went wrong. Use this to check whether a file you just added has been picked up.

#### Your content folder

Checked for new files when the app opened - nothing new. 4 files already up to date.

Paste the path of the folder that holds your decks, PDFs, Word and Excel files and images

C:\Asset Finder Demo\My content

4 files, 126.5 KB found - 3 of them are decks, PDFs, Word or Excel files or images the app can read.

Process the filesCheck for new filesLast processed: 2026-09-22 at 01:09:24

Process the files reads anything new or changed, removes anything deleted, and also fetches your YouTube captions. Check for new files does the same for the folder only, leaving YouTube alone. New files are picked up on their own each time you open the app.

#### Summary

|            |           |             |        |         |
|------------|-----------|-------------|--------|---------|
| Files seen | Processed | In progress | Failed | Skipped |
| 4          | 3         | 0           | 0      | 1       |

9 searchable pieces indexed in total. - Failed means something is wrong with the file. Skipped means a file type this app does not handle - nothing is broken.

#### All content

Most recently processed first.

| File                    | Type           | Status    | Indexed       | Processed at        | Note / reason                |
|-------------------------|----------------|-----------|---------------|---------------------|------------------------------|
| Warehouse handbook.docx | Word document  | Processed | 4 pieces      | 2026-09-22 01:02:13 |                              |
| team offsite poster.png | Image          | Processed | 1 description | 2026-09-22 01:02:00 |                              |
| Suppliers.xlsx          | Excel workbook | Processed | 4 pieces      | 2026-09-22 01:01:48 |                              |
| Old meeting notes.doc   | Doc            | Skipped   | -             | -                   | unsupported file type (.doc) |

#### Failed files (0)

No failures. Every supported file was read successfully.

#### Skipped files (1)

Not indexed as searchable documents, on purpose - nothing is wrong with them. Either the app does not handle that file type, or the file is used for something else (the link spreadsheet is read separately, to find your YouTube videos).

Old meeting notes.doc — unsupported file type (.doc)

#### Processing history

Newest first. Open a day to see exactly which files were read.

> 3 files processed on 2026-09-22

*The Processing log — your content folder, the Process the files button, and a full list of what was read.*

**Folder box** — paste the path of the folder that holds your content. The app shows how many files it found.

**Process the files** — reads your files so they become searchable. Runs in short batches; safe to pause or close any time.

**Check for new files** — picks up anything new without a full re-read.

**Summary** — how many files were seen, processed, failed, or skipped.

**All content / Failed / Skipped** — a full, honest list. "Skipped" means a file type the app does not handle (nothing wrong) — like the old .doc file in this example. "Failed" gives the plain reason.

**Processing history** — which files were read on which day, so you can confirm something was picked up.

## Frequently asked questions

---

### **Does anything I search leave my computer?**

No. The AI runs on your own machine, and your files and searches are never sent to any outside company. The app only goes online to download its parts during setup, check its search model for updates when it starts, and fetch YouTube captions if you list videos.

### **Which files can it read?**

PowerPoint decks, PDFs, Word documents (.docx), Excel workbooks (.xlsx), images (.png, .jpg) and YouTube videos. In Word and Excel files it reads the text and also the screenshots and pictures inside them. Excel works best for sheets that hold words rather than big tables of numbers. Older .doc and .xls files are not read — save them as .docx or .xlsx first. See section 4.

### **Why is my first search slow?**

The very first search after starting the app takes about 25 seconds while the search model loads. Every search after that is quick. It has not frozen — just wait a moment.

### **Do I need to keep Unsloth (or Ollama) open?**

Yes. The model runner is the engine. If searches stop working or the explanations look very basic, the first thing to check is whether your model runner is open and running.

### **What does "Skipped" mean in the Processing log?**

It is not an error. "Skipped" means the file is a type the app does not handle (like a zip file, or an older .doc or .xls file). Nothing is wrong with it. "Failed" is different — that means a file could not be read (for example, it is damaged or password-protected), and the log gives the reason.

### **Will it change or move my files?**

Never. Asset Finder only ever reads your files. It does not move, rename, delete, or upload anything. Your folders stay exactly as they are.

### **Do I have to organise or rename my files first?**

No. That is the whole point. Point it at your existing folder as-is — it reads what is inside each file, so messy names do not matter.

### **What happens if I close the app while it is still processing?**

Nothing is lost. The app remembers every file it has finished. When you open it again and press "Process the files", it skips everything already done and carries on. At most, the single file that was in progress is read again.

### **Do I have to process my files again when I add new ones?**

No. Once your library has been read the first time, new, changed, deleted, and renamed files are picked up automatically each time you open the app. There is also a "Check for new files" button if you want to trigger it yourself.

### **Can several people use it?**

Yes. One strong computer can act as the "brain" — it reads the library and answers searches, while everyone else just opens a web page in their browser. It all stays inside your own network. See the setup guide's team section. Note there is no login, so only do this on a network you trust.

### **My pictures failed to read — why?**

On Unsloth, two things to check: that both "auto-switch" settings are turned on, and that the model was downloaded together with its vision file (called "mmproj"). Then press "Process the files" again — only the missing pictures are retried.

### **My YouTube videos are not showing up.**

Check that your links spreadsheet is named public\_links.xlsx and has the right column headings. The Processing log will tell you if the headings were not recognised. Only public videos that have captions can be read.

### **Is it accurate?**

It was tested on 16 real searches on a sample library of decks, PDFs, images and YouTube videos:

- **12 searches with a known right answer** — the correct item was in the top 3 every time (12 of 12).
- **4 searches for things not in the library** — it correctly returned nothing every time (4 of 4).

This is a small, focused test of the search, not a large benchmark. Word and Excel support came later and was checked separately on a few test files. On your own library, try a handful of searches where you know the right answer. On a more powerful computer, a larger model reads pictures and writes explanations better.
